

Equipment Trials available in Muenster, Germany

We offer a trial with your own polymer to demonstrate the advantages of the Kreyenborg Group equipment, and prove the process.

In March 1999 Kreyenborg and BKG commissioned their new complete extrusion line, complete with high Torque twin screw extruder. Installed in a purpose built building, this production scale line, accepts thermoplastics of any kind and works under realistic manufacturing conditions (laboratory low throughput trials do not always scale up to production).

Our testing facility, with it's twin screw extruder, can be fitted with a variety of ancillaries –feeders, side-feeder, screen changer(discontinuous, continuous or back-flush), gear pump, start up valve and Underwater pelletizer complete with a heated water system and a centrifugal dryer.

The whole installation is controlled by a BSG computerized process visualization system with incorporated data recording (which of course demonstrates how we could control you new or existing line).

Further components of the Kreyenborg range like silos, densifiers, container mixers Infra Red Dryers etc. can be demonstrated.
